From Publishers Weekly

A linear sense of time may be well suited to our hectic, clock-watching society, but the timekeeping systems of ancient or "primitive" peoples are no less valid, suggests Aveni. Writing as both an astronomer and an anthropologist, he finds parallels between Einstein's concept of space-time and an Aztec "world diagram" which charts a 52-year calendar-round pegged to the passage of the constellation Pleiades overhead. For the semi-nomadic Nuer tribe of Sudan, "eco-time" connects people to their environment. In this wide-ranging, intriguing journey across centuries, Aveni traces the modern calendar's roots back to Greek pastoral poetry and prehistoric African bone markings, then compares Western, Chinese, Maya, Inca and tribal time systems. He also fathoms our division of time into days, weeks, months, seasons and years for clues to our psychology and worldview. He notes that scientists who believe that previous universes existed before the Big Bang echo the Maya and Aztec view of time as cyclical. Illustrations.

From Library Journal

Aveni is the author or editor of a number of books and articles about time measurement in America; in this work, his coverage is worldwide and extends from 20,000 B.C. to the present. Following a relatively brief discussion of biorhythms and of some philosophical views on the nature of time, Aveni outlines the development of the Western calendar from ancient times to today's world. Both technical details and intellectual/religious attitudes toward time are discussed. The latter half of the volume is devoted to timekeeping systems of the ancient Mayans, Aztecs, Incas, and Chinese, including some comparisons between these varied cultures and the views of modern Western civilization. This is not fully satisfactory as a study of the subject of time, but the discussion of meso-American calendars is quite interesting. Recommended for college and public libraries.

## Review

"A good book on time is a rare thing: it requires history; it requires anthropology; it requires astronomy; and it requires physics. . . . As an anthropologist and astronomer known for his detailed work on the archaeo-astronomy of south and central American cultures, [Aveni] speaks with special authority on the fascinating practices of the Mayan and Aztec cultures and their extraordinary fastidiousness with regard to the marking and meaning of time. But detailed knowledge and good judgement are not sufficient to produce a successful book. Aveni achieves that distinction by virtue of the fact that he also possesses a wonderfully eloquent and engaging prose style that carries the reader through fact after fact that could so easily have ossified into a list of deadly dullness. *Empires of Time* is one of the best books on a scientific theme for the serious general reader that I have read for some time."

—The Times Higher Education Supplement

"*Empires of Time* is a lively and readable account of humankind's attempts to understand and account for the rhythms of the cosmos. . . . [A]s Aveni ably demonstrates, the origin and cultural meaning of the world's calendars are a wonderfully complex and intriguing story, involving natural cycles, sacred meaning, and political intrigue. By focusing more than half his book on non-Western traditions, Aveni reminds us that other cultures have rich and varied concepts of the passage of time. Both laypersons and scholars will find this book rewarding."

- Ray A. Williamson, Author of *Living the Sky: The Cosmos of the American Indian*

"If there is another book like this in the English language, I don't know about it. It is written by an expert who knows how to combine first-rate scholarship and good writing. This book should be of great scientific as well as popular interest."

- Michael D. Coe, Professor of Anthropology, Yale University

Thinking about time

By Newton Ooi

This book is about how the concept of time is conceptualized, used, and measured in various cultures of human history both past and present. The cultures include the ancient Chinese, ancient Greeks, Mayas, Incas, and African tribes. The author examines archaeological and literary records to show the various instruments humans used to count the passing of time. The author also shows that the concept of linear time is actually quite unique to the modern Western world, and that this is not coincidental. Many earlier societies that lived more in harmony with nature had a more cyclic view of time, as befits a lifestyle that depends on daily, weekly, monthly, seasonal and yearly patterns. More advanced cultures such as the ancient Chinese had a cyclic view of time, but their cycles were in the millenia; possibly reflecting their knowledge of astronomical and geological phenomena that occurred over these time frames. All in all, a very interesting book and highly recommended for anyone who likes the social sciences.
