Very good but not perfect

By harbinjer

Overall an excellent book. It has a great overview of astronomy, and some good guides in what to look for in a telescope and what to look at in a telescope once you have it. Then there are whole sky star maps, and maps broken down to smaller areas. It's got plenty of targets for binoculars and small scopes. So if you're just getting started and have binoculars, but no scope yet, this is a great book. Let me emphasize (as the book does) that a department store telescope is likely worse than a \$20 binocular, because it will lead to more frustration than it is worth.

I do wish that the charts maybe had finder views of a few objects as well, perhaps in the bottom margin. A second important thing would be to warn users about what they CAN'T see from an urban or suburban location. You might think that magnitude 7-8 objects would be just visible, but many aren't. Many things that are easy from a dark sky site are very hard or impossible from a city. It doesn't emphasize this enough for beginners who don't have the experience to know this.

Other things to buy might be a plansisphere. Also a more detailed atlas like the Bright Star Atlas, The Cambridge Star Atlas, or for even more detail, the Sky & Telescope's Pocket Sky Atlas. Keep in mind that the more detail you see, the more confusing it can be. And that's another strong point of this book. The charts in here are very easy to understand and non-threatening, perfect for beginners. And lastly, if you do get a telescope, Turn Left at Orion: A Hundred Night Sky Objects to See in a Small Telescope--and How to Find Them is a great book too. It has very detailed directions for finding everything in there. So if you can't find some of the objects in here, Turn left at Orion will probably help.

I also want to mention that the spiral binding works great for the star maps to keep the book easily open and flat.

Hurry Buy THIS book

By Born to Read

If you are a beginner, buy this book immediately. It is probably fabulous for the rest of you, too. :) I am just getting started myself and have spent just a short time with it. I look forward to learning and appreciating it

even more. Beginners absolutely need it. Try to read before you get a telescope, but even if you have made a purchase, will be able to help you make best use of it and help you avoid frustration.

This book is first of all beautiful with many color photographs to enhance the comprehensive text. The content is engaging and easy-to-understand.

Buy, enjoy, and have fun. Also, the book is worth the \$35.00 price, but Amazon has a great discount.

This is an excellent starter for visual astronomy

By Carnel

This is an excellent starter for visual astronomy. I began stargazing at age 12 and I so wish I had this comprehensive guide back then. The star maps are among the best I have seen for the lay person. It also includes a list of must-see objects and adds insight on observing them. The comments are awesome for the small telescope user and gives much advice on the pitfalls of purchasing one. Nightwatch is incredible for binoculars and small telescopes but includes much more.
